

Relay service improvement case study

One page summary | Independent portfolio exercise | Version 1.0

A complete BA case study for improving routine IT fault handling in a fictional licensing support unit.

Problem and context

Email, phone and spreadsheet intake lead to missing information, unclear ownership and closure without verified restoration. The scenario reflects system operationalisation and public-sector service needs. It contains no real police, licensing, staff or applicant data.

Approach

Model seven stakeholder groups and six simulated findings; map current and future hand-offs; analyse seven gaps; define 12 prioritised requirements with acceptance criteria; map risks and governance; build and test a working service workflow; plan a controlled pilot and benefits review.

What is complete

A working browser prototype with structured intake, priority rules, assignment, controlled state changes, rejection and confirmed closure, searchable queue, CSV export and local event history. Fifteen automated domain checks and one browser integration review passed. Editable maps, requirements, test cases, controls, change plan and management briefing accompany the prototype.

Targets and evidence boundaries

Synthetic baseline: 50 faults, 12 minutes active handling per fault, 72% complete intake and 60% confirmed closure. Proposed targets: ≤ 6 minutes handling, $\geq 95\%$ completeness and 100% confirmed closure. Potential capacity: 5 hours per month at the assumed volume. No real benefits, stakeholder consultation, business UAT or production compliance are claimed.

Recommendation and release gates

Assess an existing approved service platform first. Consider an approved Microsoft 365 pilot only if required. Validate identity and permissions, privacy, classification, records, restore and support before live data. A four-week pilot and sponsor review determine whether to expand.

Tools: stakeholder analysis, swimlanes, gap matrix, BRD, stories, traceability, JavaScript prototype, versioned evidence and Microsoft 365 delivery blueprint. Role alignment: all nine QPS AO5 capabilities.
